Ceiling Water Damage Repair: What to Do When Water Comes From Above

Canonical Web Version: https://restorationintel.com/ceiling-water-damage-repair/

Direct Answer: A water-stained ceiling means water has already traveled — the wet cavity above joists is almost always larger than the visible stain. Follow the ANSI/IICRC S500 repair sequence: stop the source, drain trapped pockets safely, open and dry the cavity to dry-standard targets, remove saturated porous materials, then rebuild.

Field Benchmark & Decision Matrix

Inspection Gate	Technical Threshold / Standard	Required Field Action	Insurance & Scope Documentation
Thermal IR + Capacitance	Compare wet drywall against unaffected dry room control.	Map full joist-bay water travel beyond paint ring.	Attach annotated IR photos to Xactimate sketch.
Insulated Pin Meter Check	Verify wood joists & subfloor hit dry-standard goal.	Dry exposed framing cavities before re-hanging rock.	Supports daily LGR & air-mover runtime logs.
Sagging Drywall Relief	Fastener pull-through or bulging seam above room.	De-energize fixtures; drill controlled drain hole over bin.	Never paint stains over wet paper-faced gypsum.
Cat. 1 vs. Cat. 2/3 Source	Clean supply pipe vs. drain line or roof/attic runoff.	Remove wet insulation & contaminated drywall assemblies.	Roof leaks need documented wind-created opening.
Multi-Floor & NFIP Split	Interior drain-down vs. exterior rising groundwater.	Separate burst-pipe interior scope from flood lines.	Align basement exclusions with 44 CFR Part 61.

Practitioner Operational Takeaways

- Measure past the visible ceiling stain edge with thermal imaging and pin-less meters before cutting.
- Drain sagging ceiling bellies deliberately from the lowest edge into catch basins after shutting off power.
- Pull wet fiberglass or blown-in insulation and dry framing to ANSI/IICRC S500 dry-standard equilibrium prior to closing.
- Photograph damaged supply lines, wind openings, and saturated rock in place to defend against wear-and-tear denials.
